- 425 IOOF st, Denton, Texas

PROFILE SUMMARY

Master's student in Computer Science with a strong foundation in software engineering, object-oriented programming, and data-driven application development. Proficient in Java and Python, with hands-on experience building web applications and implementing machine learning models for real-world use cases. Developed and deployed projects for design, develop, and optimize scalable, maintainable software solutions in collaborative environments.

EDUCATION

2024 - 2026
UNIVERSITY OF NORTH TEXAS

- Master of Computer Science

2020 - 2024
BVRIT, NARSAPUR, INDIA

- Bachelor of Computer Science
- GPA: 8.37 / 10

SKILLS

- Python
- OOPS
- DSA
- SQL
- Nodejs
- AI/ML
- SDLC

LANGUAGES

- English: Fluent
- Hindi: Fluent
- Telugu: Fluent

PROJECTS

Attendance Management System 2025

- Designed and developed a web-based Attendance Management System to automate student attendance tracking and record management. Implemented core features including user authentication, role-based access (admin/faculty/student), attendance marking, face recognition and report analysis.
- Used Python, MongoDB, and web technologies to ensure reliable data storage and efficient retrieval. Improved accuracy and reduced manual effort by digitizing attendance workflows.
- Focused on clean code practices, modular design, and basic input validation for data integrity.

Credit card Fraud Detection Using Ensemble learning 2025

- Developed a fraud detection system using ensemble learning to identify fraudulent online transactions. Implemented stacking with Logistic Regression, Random Forest, XGBoost, and a Neural Network as a meta-model.
- Applied advanced oversampling techniques (SMOTE, ADASYN, SVMSMOTE) to handle severe class imbalance. Performed feature engineering to improve model performance and robustness.
- Achieved improved precision, recall, and overall accuracy compared to individual models.

Credit Card Fraud Detection Using XGBOOST and LSTM 2024

- Developed a hybrid fraud detection system combining LSTM for sequential pattern learning and XGBoost for high-accuracy classification. Performed data preprocessing, feature selection, and normalization to improve model performance.
- Addressed highly imbalanced transaction data to enhance fraud detection accuracy. Leveraged LSTM to capture temporal transaction behavior and XGBoost to handle complex decision boundaries.
- Built a robust and adaptive system capable of detecting evolving fraud patterns.
